

HOSPITAL PATIENT ADMISSIONS DASHBOARD

Problem Statement

Hospitals generate large volumes of patient data containing information such as admission dates and times, patient demographics, department referrals, admission status, waiting time, and patient satisfaction. When this information is maintained as raw data, it can be difficult to identify important patterns, trends, and key performance indicators efficiently.

The **Hospital Patient Admissions Dashboard** project aims to transform a dataset containing **9,217 patient records and 11 columns** into an interactive and informative Excel dashboard.

The dashboard will analyze patient admission patterns, demographic characteristics, department referrals, waiting times, and available patient satisfaction scores. Using **data preprocessing, PivotTables, KPIs, charts, and slicers**, the project will present the information in a clear visual format.

The dashboard will help users understand overall patient activity, compare admission and non-admission records, identify referral patterns, analyze waiting times, examine demographic distributions, and observe trends over time.

The final objective is to convert raw hospital patient data into a **clear, interactive, and easy-to-understand dashboard** that supports effective analysis and helps users derive meaningful insights from the available data.

Dataset Insights

Dataset Name: Hospital Patient Flow / Admissions Dataset

Total Records (Rows): 9,217

Total Columns: 11

Data Type: Patient admission and healthcare-related data

Time Period: 2023–2024

Primary Analysis: Patient admissions and hospital visit patterns

Column Details

No.	Column Name	Description
1	Patient Id	Unique identifier for each patient record
2	Patient Admission Date	Date on which the patient visited/admission process was recorded
3	Patient Admission Time	Time of the patient's visit/admission
4	Merged	Patient name field present in the raw dataset
5	Patient Gender	Gender of the patient
6	Patient Age	Age of the patient
7	Patient Race	Race/ethnicity category recorded for the patient
8	Department Referral	Department to which the patient was referred
9	Patient Admission Flag	Indicates whether the patient was admitted or not admitted
10	Patient Satisfaction Score	Satisfaction score provided by the patient, where available
11	Patient Waittime	Waiting time recorded for the patient

Main Data Categories

Patient Information

- Patient ID
- Patient name
- Gender
- Age
- Race

Admission Information

- Admission date
- Admission time
- Admission status

Hospital Service Information

- Department referral
- Patient waiting time

Patient Feedback

- Patient satisfaction score

Key Characteristics

- The dataset contains 9,217 patient records.
- It contains 11 columns covering demographics, admission details, referrals, waiting time, and satisfaction.
- The dataset contains records from 2023 and 2024, allowing us to perform time-based analysis.
- The Patient Satisfaction Score contains some blank values, which will need to be handled appropriately during data preprocessing.
- Department Referral includes categories such as General Practice, Orthopedics, and None.
- Patient Admission Flag contains categories such as Admission and Not Admission.
- Patient Waittime is a numerical field that can be used to calculate average and other waiting-time metrics.
- The dataset can support analysis using PivotTables, KPIs, charts, slicers, and dashboards.
